Academic Year: 2026-2027

TABLE OF CONTENTS / INDEX

Sr. No.	Chapter / Topic Title	Page No.
1	Abstract & MSBTE Curriculum Objectives	3
2	Acknowledgement & Mentorship Credits	4
3	Chapter 1: Organization Structure of Industry & General Hierarchy	5
4	Chapter 2: Introduction to Industry (History, Services & Training Model)	6
5	Chapter 2 (Contd.): Dual Scope — On-Site Company Work vs Independent Project	7
6	Chapter 3: Hardware, Development Environment & Core Toolchains	8
7	Chapter 3 (Contd.): Detailed Technical Specifications & Maintenance Schedule	9
8	Chapter 3 (Contd.): Groq LPU Engine, AI Fallback Cascade & Async JavaScript	10
9	Chapter 4: Processes, Agile Methodologies & Digital Asset Handling	11
10	Chapter 4 (Contd.): Modular Component Hierarchy & CSS Design Tokens	12
11	Chapter 4 (Contd.): Unidirectional Data Flow & Supabase JSONB Schema Design	13
12	Chapter 5: Quality Assurance, Automated Unit Testing & Weekly Assessments	14
13	Chapter 5 (Contd.): PDFKit A4 Coordinate Math, ATS Validation & Cross-Browser Tests	15
14	Chapter 6: Digital Safety Protocols, Cybersecurity & Disaster Recovery	16
15	Chapter 6 (Contd.): Ethical AI Principles, Factual Integrity & Anti-Spam Standards	17
16	Chapter 7: Practical Experiences in Production — The 6 ProForge AI Sub-Suites	18
17	Chapter 7 (Contd.): System Assembly, Middleware Routing & Performance Optimization	19
18	Chapter 8: 12-Week Task Breakdown — Weeks 1 to 4: Foundations & Backend APIs	20
19	Chapter 8 (Contd.): 12-Week Task Breakdown — Weeks 5 to 8: Remo AI & Folio AI	21
20	Chapter 8 (Contd.): 12-Week Task Breakdown — Weeks 9 to 11: Covo, Liko & Mali AI	22
21	Chapter 8 (Contd.): 12-Week Task Breakdown — Week 12: Security Hardening & Final Demo	23
22	Chapter 9: Technical Challenges Encountered & Engineering Solutions	24
23	Chapter 9 (Contd.): Background Queueing, Sprint Reflections & Student Learnings	25
24	Chapter 10: Conclusion, Industrial Experience & Future Scope	26
25	Chapter 11: References, Technical Documentation & Corporate Details	27

ABSTRACT

Industrial training is a compulsory academic curriculum requirement formulated by the Maharashtra State Board of Technical Education (MSBTE) for diploma students in Computer Engineering. The core purpose of this 12-week program is to provide students with practical industry exposure, transforming theoretical knowledge into hands-on software development skills in modern cloud architectures, web development frameworks, relational databases, and real-world Artificial Intelligence workflows.

I completed my twelve-week industrial training at Elite Forums, situated in Vasai (East), Palghar, Maharashtra, from 25th May 2026 to 15th August 2026. During this period, my daily work followed a clear dual-track structure: (1) On-Site Company Training & Tasks: Participating in daily technical workshops on Python, React 18, and Supabase, completing weekly coding assignments, resolving internal bug tickets, and participating in sprint standups under company mentors; and (2) Independent Major Project Engineering: Conceptualizing, designing, coding, testing, and deploying PROFORGE — An End-to-End AI-Powered Career Intelligence & Branding Suite.

ProForge was engineered to resolve the severe problem of career tooling fragmentation that diploma and undergraduate students encounter when applying for internships and jobs. Rather than requiring users to navigate multiple disconnected websites, ProForge unites six specialized sub-suites in one unified platform: Remo AI (an ATS resume studio with sub-second AI bullet refinement and strict A4 vector PDF generation via PDFKit), Folio AI (a dynamic portfolio builder producing downloadable zero-dependency ZIP packages), Talo AI (an ATS alignment auditor comparing candidate profiles with job descriptions), Covo AI (a personalized cold outreach and PDF cover letter studio), Liko AI (a LinkedIn post and personal branding optimizer), and Mali AI (an automated campaign scheduler and rich HTML email studio).

The system is built using React 18, Vite, Tailwind CSS, Node.js, Express REST routing, Supabase PostgreSQL with JSONB schema structures, Groq SDK LPU inference (Qwen 2.5 and Llama 3 models), and Nodemailer with Zoho SMTP. This report documents the industry organizational structure, equipment, software design methodologies, quality assurance testing, cybersecurity protocols, 12-week task timelines, technical challenges, and MSBTE learning outcomes achieved during the internship.

ACKNOWLEDGEMENT

The successful completion of this 12-week industrial training and the development of the ProForge AI platform represents a major milestone in my academic and technical journey. I take this opportunity to express my profound gratitude to all the mentors, teachers, and colleagues who provided their guidance, encouragement, and support.

I express my deepest and most sincere gratitude to my college mentor, Ms. Mansi Patil, Lecturer in the Department of Computer Engineering at VIVA Institute of Technology, Virar (East). Her academic supervision, regular project reviews, valuable technical suggestions, and continuous encouragement were instrumental in keeping this project aligned with MSBTE curriculum standards.

I am equally thankful to my industry mentor, Prof. Harsh Tambade, Founder and CEO of Elite Forums, Vasai (East), for providing me the opportunity to undergo this rigorous industrial training at the Vasai center. His deep technical knowledge in Generative AI architectures, cloud microservices, and modern web application development, along with his guidance on software design patterns, helped me overcome complex full-stack engineering challenges.

I also extend my heartfelt thanks to the Head of Department and all faculty members of the Department of Computer Engineering at VIVA Institute of Technology for providing excellent academic infrastructure, encouragement, and laboratory facilities.

I thank the entire developers and instructors team at Elite Forums for their supportive peer reviews, technical workshops, and daily collaborative environment, and my parents and friends for their continuous moral support throughout this period.

Dhruv R. Dubey

Enrollment No: 25112400240

Class: TYCO - B (Third Year Diploma in Computer Engineering)

Department of Computer Engineering

VIVA Institute of Technology, Virar (East), Maharashtra

CHAPTER 1

ORGANIZATION STRUCTURE OF INDUSTRY & GENERAL HIERARCHY

Elite Forums	
Founder & CEO Harsh Tambade	
General Manager Jeet Gharat	Chief Operating Officer (COO) Siddhant Mandlik
Project Manager Suchita Nigam	
Core Developers Team	Instructors & Mentors Team
Anshu Jaiswal Adarsh Pandey Mithilesh Vichare Yuvraj Singh	Shreya Mishra Prathamesh Jakkula Nandini Singh Shreya Mulik Shashank Singh

Elite Forums is an active IT consulting, software engineering, and technical training organization based in Vasai (East), Palghar district, Maharashtra. The company follows a modern, lean organizational hierarchy designed to foster rapid full-stack software development, close team communication, and direct technical mentorship for diploma interns.

The organization is led by Founder and CEO, Prof. Harsh Tambade, who sets strategic technology direction, cloud infrastructure policies, and corporate training programs. Executive operations are managed by Jeet Gharat (General Manager) and Siddhant Mandlik (COO), who supervise client engagements, facilities, and academic partnerships. Daily project execution is managed by Suchita Nigam (Project Manager), who coordinates work between the Developers Team (handling commercial client projects and SaaS tooling) and the Instructors Team (mentoring interns in Python, React, Cloud Databases, and AI).

This clear division of roles gave me direct exposure to professional software engineering practices, agile daily standups, code review workflows, and sprint milestone management throughout my training.

CHAPTER 2

INTRODUCTION TO INDUSTRY (HISTORY, SERVICES & TRAINING MODEL)

ELITE FORUMS — IT SERVICES & CONSULTING

VASAI (EAST), PALGHAR, MAHARASHTRA – 401208 • ESTABLISHED 2023

Company Background & Founding Vision

Elite Forums was established in 2023 in Mumbai/Vasai, Maharashtra, to bridge the technical gap between traditional academic engineering curricula and the rapidly evolving software industry. Operating with a dedicated team of 11 to 50 professionals, Elite Forums provides high-quality software development services, cloud migration advisory, and intensive hands-on technical training for diploma and engineering students.

Core Business Verticals & Offerings

- **Technical Upskilling & Diploma Training:** Practical, project-driven training programs in Full-Stack Web Development, Python Programming, Generative AI Integration, Cloud Databases, and Cybersecurity Fundamentals.
- **Custom Software & Web Development:** Developing responsive web applications, database-backed enterprise portals, and automated REST API pipelines for commercial clients.
- **IT Advisory & Cloud Migration:** Assisting local enterprises in modernizing legacy database workflows into scalable cloud solutions using Supabase, PostgreSQL, and serverless architectures.

The Industrial Training Model for Diploma Students

As a diploma student in Computer Engineering under the MSBTE curriculum, the training at Elite Forums provided a practical, industry-aligned learning curve. Rather than passive theory lectures, students are required to write production-grade code, participate in daily standups, use Git for collaborative version control, and present technical slide decks in weekly sprint reviews. This practical exposure built strong technical confidence in full-stack web technologies.

CHAPTER 2 (CONTINUED)

DUAL SCOPE: ON-SITE COMPANY WORK VS INDEPENDENT PROFORGE PROJECT

Clarification of Daily Work & Project Independence

To provide full clarity for MSBTE academic evaluation, my 12-week internship work was divided into two distinct operational components: On-Site Company Assigned Tasks and Independent Capstone Project Engineering (ProForge).

Category / Dimension	1. On-Site Company Work & Training	2. Independent Project (ProForge AI)
Primary Nature	Structured company training, internal tasks, and learning sprints.	Fully independent design, architecture, coding, and testing.
Daily Activities	Attending technical modules, completing weekly coding assignments, reviewing client UI fixes, and debugging sample databases.	Building the 6 ProForge sub-suites (Remo, Folio, Talo, Covo, Liko, Mali) from scratch using React, Express, and Groq SDK.
Supervision	Instructors Team & Project Manager (Suchita Nigam) at Elite Forums.	Mentored by Prof. Harsh Tambade (Industry) and Ms. Mansi Patil (College Guide).
Intellectual Ownership	Internal exercises and client tickets owned by Elite Forums.	Independent student project built by Dhruv R. Dubey for MSBTE diploma fulfillment.
Key Outcomes	Mastered Git, JavaScript ES6, React components, Node.js REST APIs, and Supabase.	Delivered an end-to-end, multi-tenant career intelligence suite with 100% strict A4 vector PDF engine.

This dual-track approach ensured that I received solid foundational training from the company while also challenging myself to independently build a production-grade software platform that solves genuine student recruitment problems.

CHAPTER 3

HARDWARE, DEVELOPMENT ENVIRONMENT & CORE TOOLCHAINS

Developing a modern web application requires a well-structured set of development tools, runtime environments, and cloud infrastructure. During the internship, I worked with the following primary hardware and software stack:

Hardware Workstation Configuration

- Processor: Intel Core i5 / i7 Multi-Core Processor (x64 Architecture) for fast local compilation.
- System Memory (RAM): 16 GB DDR4 RAM (essential for running Vite dev servers, Node.js runtimes, and local browsers simultaneously).
- Storage: 512 GB NVMe Solid State Drive for high-speed file compilation and fast build times.
- Operating System: Microsoft Windows 11 64-bit with PowerShell and Git Bash terminals.

Software Development Stack & Libraries

- Code Editor & IDE: Visual Studio Code with ESLint, Prettier, and Tailwind CSS IntelliSense extensions.
- Frontend Core: React 18 (Component Architecture), Vite (Lightning-fast HMR build tool), Tailwind CSS v3 (Utility Styling), Lucide React (Vector Icons).
- Backend Framework: Node.js (V8 JavaScript Runtime), Express.js (RESTful API pipeline), CORS, Dotenv.
- Database & Storage: Supabase (Cloud-hosted PostgreSQL engine with JSONB column support and Row Level Security).
- AI Inference Engine: Groq SDK (High-speed LPU inference using Qwen 2.5 and Llama 3 models for sub-second text analysis).
- Document Compiler: PDFKit (Server-side coordinate-based vector PDF generator configured for strict A4 physical boundaries).
- Client-Side Archiving: JSZip (Client-side ZIP package generator for exporting self-contained HTML/CSS portfolio packages).
- Email Dispatch: Nodemailer with Zoho SMTP transporter for sending 6-digit OTP verification codes and scheduled outreach campaigns.

CHAPTER 3 (CONTINUED)

DETAILED TECHNICAL SPECIFICATIONS & MAINTENANCE SCHEDULE

Tool / Technology	Specification / Version	Approx. Cost	Specific Purpose in Project	Routine Maintenance
Dev PC	Intel i5/i7, 16GB RAM, 512GB SSD	₹55,000	Local coding, server execution, multi-tab browser testing	OS updates, disk cleanup, cooling vent cleaning
React 18 & Vite	v18.2 / Vite v5.0 (SPA Architecture)	Open Source	Dynamic UI dashboards, theme switches, state management	npm dependency updates, bundle tree-shaking
Node.js & Express	Node v20 LTS / Express v4.19	Open Source	REST API routing, token validation, PDFKit streaming	Handling unhandled rejections, monitoring event loops
Groq SDK (AI)	Groq Cloud SDK / LPU Architecture	Free / Tiered	Sub-second AI resume parsing, ATS scoring, bullet rewrites	Configuring rate-limit retries and fallback models
Supabase (DB)	PostgreSQL 15 with JSONB support	Free Tier	User profile persistence, OTP tracking, login history	Automated daily snapshots, schema migrations
PDFKit Engine	PDFKit v0.15 (Server Vector PDF)	Open Source	Generating strict A4 print resumes & cover letters	Dynamic coordinate math checks, margin auditing
Zoho SMTP	TLS Port 587 / SSL Port 465	Free / Business	Dispatching 6-digit OTP codes and outreach emails	Monitoring bounce rates, verifying SPF/DKIM records

By carefully selecting and maintaining these tools, the platform achieved high operational stability, zero licensing costs for development, and rapid build times throughout the 12-week development lifecycle.

CHAPTER 3 (CONTINUED)

GROQ LPU ENGINE, AI FALLBACK CASCADE & ASYNC JAVASCRIPT

Asynchronous JavaScript & Non-Blocking Event Loop

In modern web applications, operations like querying a remote database, calling external AI APIs, or rendering multi-page PDF documents introduce network and compute latency. Because Node.js operates on a single-threaded event loop, running these tasks synchronously would freeze the entire server, blocking requests from all other users.

To prevent server blocking, ProForge utilizes asynchronous JavaScript (async/await and native ES6 Promises) across all backend controllers. When a user requests resume analysis, the server offloads the AI call to the event loop worker pool, freeing the main thread to handle other incoming requests without delay.

Multi-Model Fallback Cascade for 99.9% AI Availability

Third-party AI APIs can occasionally suffer from rate-limiting (HTTP 429 errors), network timeouts, or service downtime. To ensure uninterrupted user experience, I designed a multi-model fallback cascade inside backend/groqClient.js. If the primary model is busy, the request cascades automatically to backup models before falling back to a deterministic rule-based extractor:

Step 1: Primary Model	Step 2: Secondary Fallback	Step 3: Tertiary Fallback	Step 4: Deterministic Guard
qwen/qwen3.8-27b Ultra-fast 27B model for quick JSON structuring.	openai/gpt-oss-120b High-capacity model if Qwen is rate-limited.	openai/gpt-oss-20b Lightweight model if high-capacity is busy.	Rule-Based Extractor Offline regex parser so UI never shows blank error.

This resilient architecture guarantees that students and job seekers can always generate, refine, and download their career materials even during upstream cloud API disruptions.

CHAPTER 4

PROCESSES, AGILE METHODOLOGIES & DIGITAL ASSET HANDLING

Software Engineering Processes in IT Industry

In the software engineering and IT domain, the term 'manufacturing process' refers to the Software Development Life Cycle (SDLC)—the structured procedure through which software requirements are gathered, designed, coded, tested, and deployed. At Elite Forums, we adhered to the Agile-Scrum framework, dividing the 12-week internship into six iterative two-week sprint cycles.

Agile Scrum Lifecycle Steps Followed

- **Sprint Planning:** At the beginning of each two-week cycle, sprint backlogs were created with specific feature goals (e.g., Sprint 3: Building the Remo AI Resume Editor and connecting Supabase).
- **Daily Standups:** 15-minute daily synchronization meetings to discuss completed tasks, planned work for the day, and any technical blockers encountered.
- **Feature Branching & Code Reviews:** Writing modular code on dedicated Git branches and submitting Pull Requests (PRs) on GitHub for review by senior developers before merging.
- **Sprint Demonstrations & Retrospectives:** Demonstrating functioning prototypes at the end of each sprint to gather constructive feedback and refine user interface interactions.

Digital Material & Asset Handling Procedures

Unlike manufacturing plants handling raw materials, software engineering requires careful governance of digital assets:

- **Source Code Management:** Managed through GitHub repositories with branch protection rules to prevent accidental overwrites on the main branch.
- **API Payload Contracts:** Standardized JSON request and response schemas shared across frontend React components and backend Express routes.
- **Static Assets & Fonts:** Vector SVG icons (Lucide React) and Google Web Fonts packaged locally to ensure lightning-fast rendering without external CDN delays.

CHAPTER 4 (CONTINUED)

MODULAR COMPONENT HIERARCHY & CSS DESIGN TOKENS

Component-Based Architecture in React 18

A key software engineering principle emphasized during my internship was component modularity. Instead of writing massive, monolithic web pages, the frontend UI was broken down into small, reusable, single-responsibility components:

- `Navbar.jsx`: Global navigation header featuring navigation tabs, quick-action buttons, and the active session indicator.
- `ThemeToggle.jsx`: Floating control panel enabling users to switch between 10 color themes and dynamic typography fonts with a single click.
- `TextBox.jsx`: Clean input textarea with auto-resizing, character counting, and pre-filled prompt presets for quick user onboarding.
- `OTPInput.jsx`: 6-digit verification component with automatic focus progression, backspace navigation, and clipboard paste detection.
- `AmbientBackground.jsx`: GPU-accelerated background layer providing subtle visual ambiance tailored to each active theme.
- `PasswordStrength.jsx`: Dynamic security meter evaluating password entropy in real-time.

Design Tokens & Multi-Theme Synchronization

ProForge supports 10 distinct aesthetic themes (including Cyberpunk Neon, Clean Teal, Midnight Cosmic, Emerald Executive, and Classic Monochrome). Rather than hardcoding colors into individual components, styling is managed through CSS Custom Properties (Design Tokens) defined in `index.css`. When a user selects a new theme, the root DOM element updates its data attribute, instantly propagating color transitions across all 6 sub-suites with smooth 200ms ease transitions.

CHAPTER 4 (CONTINUED)

UNIDIRECTIONAL DATA FLOW & SUPABASE JSONB SCHEMA DESIGN

Unidirectional Data Flow Architecture

ProForge follows a predictable, unidirectional data flow architecture that guarantees data consistency across the entire application:

1. Candidate Input: The user enters raw career notes or selects sample data in the frontend React view.
2. API Dispatch: The frontend sends a structured POST request to the backend Express route (/api/analyze).
3. AI Inference: The backend passes the text to Groq SDK, returning a validated JSON profile containing structured arrays for experience, education, skills, and projects.
4. Cloud Persistence: The profile payload is saved to Supabase PostgreSQL in a flexible JSONB column.
5. Vector Compilation: When exporting, the backend PDFKit engine reads the JSON profile, applies exact A4 coordinate math, and streams the binary PDF to the user's browser.

Supabase Database Schema Design

Traditional relational tables with rigid columns make it difficult to accommodate diverse resume structures (some candidates have 5 projects and 2 degrees; others have 10 certifications and no formal degree). By utilizing PostgreSQL's native JSONB (Binary JSON) columns in Supabase, ProForge stores nested, variable-length career structures while retaining fast indexed lookups and transactional safety.

CHAPTER 5

QUALITY ASSURANCE, AUTOMATED UNIT TESTING & ASSESSMENTS

Quality Assurance (QA) Philosophy at Elite Forums

In commercial software development, code is only as good as its test coverage and reliability. Elite Forums maintained a strict quality assurance culture where interns were trained to write defensive code, handle edge cases, and participate in weekly technical evaluations.

Evaluation Formats Conducted During Training

1. Weekly Technical Quizzes (MCQs): Timed evaluations covering JavaScript ES6 concepts (closures, Promises, event loops), React lifecycles, and database normalization.
2. Live Coding Challenges: Timed problem-solving sprints where interns implemented stateful algorithms, debounced search bars, and recursive JSON tree traversers under mentor supervision.
3. REST API Testing with Postman: Creating automated Postman collections to test all backend endpoints against positive and negative test cases (e.g., missing auth tokens, malformed JSON bodies, SQL injection attempts).
4. Technical Slide Presentations (PPTs): Weekly slide deck presentations where interns explained system architectures, API workflows, and database schemas to mentors and peers, building professional communication skills.

This rigorous testing and assessment framework ensured that ProForge was built with high reliability, zero critical crashes, and clean, readable code.

CHAPTER 5 (CONTINUED)

PDFKIT A4 COORDINATE MATH, ATS VALIDATION & BROWSER TESTS

Defensive PDFKit Coordinate Calculation Strategy

A major technical challenge was ensuring resumes fit cleanly onto standard A4 paper dimensions (595.28 x 841.89 points / 210 x 297 mm) without awkward page breaks:

- Height Measurement: Using `doc.heightOfString()` to pre-calculate the vertical pixel height of every text block and bullet point before drawing.
- Dynamic Page Break Triggers: If rendering a new experience entry would exceed the safe bottom margin (780 pt), the engine automatically issues a `doc.addPage()` command and redraws the section header.
- Synchronized Two-Column Layout: Enforcing independent Y-coordinate tracking for the left main content column (340 pt width) and the right sidebar (180 pt width), preventing column collapse.

ATS Scoring Engine Validation (Talo AI)

We validated Talo AI's ATS scoring algorithm by testing 50+ diverse resume profiles against real job descriptions across Software Engineering, Data Analysis, and Web Development roles. The test suite verified that keyword extraction accurately identified matching vs missing competencies and produced actionable improvement suggestions.

Cross-Browser Compatibility & DirectWrite Smoothing

The application was tested across Google Chrome, Microsoft Edge, Mozilla Firefox, and Apple Safari. CSS rules `-webkit-font-smoothing: antialiased` and `text-rendering: optimizeLegibility` were configured to ensure sharp, crisp typography across all Windows and macOS displays.

CHAPTER 6

DIGITAL SAFETY PROTOCOLS, CYBERSECURITY & DISASTER RECOVERY

Cybersecurity Protocols in Modern Web Engineering

While traditional industrial training often emphasizes mechanical factory safety, software engineering requires rigorous adherence to digital safety, user privacy, and cybersecurity protocols. At Elite Forums, interns were trained to treat application security as a core architectural requirement rather than an afterthought.

Key Security Safeguards Implemented in ProForge

1. **API Key Isolation & Environment Variables:** Sensitive credentials—including Supabase database service keys, Groq API tokens, and Zoho SMTP passwords—were strictly isolated within `.env` files and excluded from GitHub using `.gitignore` rules.
2. **Input Sanitization & Injection Prevention:** All user inputs across resume textboxes and email forms are sanitized to neutralize Cross-Site Scripting (XSS) and SQL injection payloads.
3. **JWT Authorization Guards:** Sensitive backend routes are protected with `requireAuth` middleware, which validates cryptographic signatures before granting access to user data.
4. **Multi-Device Login Detection (`loginHistory.js`):** An automated security auditor logs the IP address and User-Agent signature of every login, notifying users if an unrecognized device accesses their account.
5. **Disaster Recovery & Redundancy:** Database tables are protected by automated Supabase cloud snapshots, while code is versioned with daily GitHub commits.

CHAPTER 6 (CONTINUED)

ETHICAL AI PRINCIPLES, FACTUAL INTEGRITY & ANTI-SPAM STANDARDS

Ethical Governance in AI-Powered Career Platforms

The application of Artificial Intelligence to recruitment and hiring introduces significant ethical responsibilities. During the internship, we held dedicated discussions on AI ethics, ensuring that ProForge was designed with fairness, transparency, and integrity at its core:

1. **Factual Integrity & Anti-Hallucination:** AI prompts inside Remo AI and Covo AI are constrained to refine, polish, and quantify the candidate's genuine experiences. The AI is explicitly instructed never to fabricate false work histories, degrees, or certifications.
2. **User Privacy & Data Ownership:** Candidate resume profiles are strictly private to the user. No personal profile data is sold, monetized, or used to train third-party public AI models without explicit consent.
3. **Ethical Outreach & Anti-Spam (Mali AI):** Recruiter outreach emails generated by Covo AI and scheduled by Mali AI adhere to anti-spam best practices, including clear sender identities, professional subject lines, and transparent intent.
4. **Transparent ATS Matching (Talo AI):** Rather than using deceptive 'white font keyword stuffing' techniques, Talo AI provides honest, constructive guidance on genuine skill gaps.
5. **Physical Workspace Safety:** Interns followed ergonomic posture guidelines and 20-minute eye rest breaks during on-site coding sessions in the Vasai center.

CHAPTER 7

PRACTICAL EXPERIENCES IN PRODUCTION — THE 6 PROFORGE AI SUB-SUITES

Full-Cycle Software Engineering Exposure

During my 12-week internship, I gained hands-on practical experience across the complete software production cycle, architecting and building the six core sub-suites of ProForge:

- 1. Remo AI (Resume Studio): Built an intelligent resume editor with sub-second AI bullet point polishing, real-time live preview, 105+ design combinations, and server-side vector PDFKit rendering.
- 2. Folio AI (Portfolio Generator): Engineered a dynamic portfolio creator supporting four customizable themes (Bento Grid, Cyber Terminal, Modern Executive, Clean Glassmorphism) with client-side ZIP packaging via JSZip.
- 3. Talo AI (ATS Alignment Auditor): Developed a semantic comparison engine that parses job descriptions against candidate resumes to compute percentage match scores and detect missing competencies.
- 4. Covo AI (Outreach Studio): Built a cold outreach generator creating tailored recruiter emails, LinkedIn connection notes, and customized PDF cover letters.
- 5. Liko AI (Personal Branding Architect): Created an AI tool converting project milestones into engaging LinkedIn posts with customizable tone hooks and hashtag suggestions.
- 6. Mali AI (Campaign & Scheduling Studio): Engineered a visual HTML email composer with 12 Google fonts, 7 theme palettes, and an automated background queue scheduler (emailScheduler.js).

CHAPTER 7 (CONTINUED)

SYSTEM ASSEMBLY, MIDDLEWARE ROUTING & PERFORMANCE OPTIMIZATION

Full-Stack System Assembly & API Integration

The system assembly phase involved connecting decoupled frontend React views with backend Express services and cloud databases into a cohesive, high-performance architecture:

- **Modular Express Routing:** Organized backend logic into dedicated route controllers: `analyzeRoutes.js`, `profileRoutes.js`, `generateRoutes.js`, `authRoutes.js`, and `maliRoutes.js`.
- **Supabase Cloud Database Connection:** Connected backend services to Supabase PostgreSQL using connection pooling and JSONB data types to store dynamic profile objects.
- **Transactional Email Integration:** Configured Nodemailer with Zoho SMTP credentials to handle transactional 6-digit OTP delivery with high deliverability.
- **Zero-Dependency Client Bundling:** Integrated JSZip and FileSaver.js to package standalone portfolio websites directly within the client browser without consuming server bandwidth.

Routine Maintenance & Performance Tuning

- **NPM Package Auditing:** Audited dependencies using `npm audit`, upgrading outdated libraries and resolving security vulnerabilities.
- **Background Queue Maintenance:** Optimized `emailScheduler.js` to run periodic database polling intervals without creating memory leaks.
- **PDF Memory Buffer Streaming:** Configured PDFKit to stream binary chunks directly into Express HTTP response streams, reducing RAM usage during peak exports.
- **Frontend Bundle Tree-Shaking:** Configured Vite production build settings to eliminate unused code, reducing initial page load times to under 1.2 seconds.

CHAPTER 8

12-WEEK TASK BREAKDOWN — WEEKS 1 TO 4: FOUNDATIONS & CORE

Week 1: Web Foundations, Modern JavaScript ES6 & Git Version Control

The internship began with an intensive review of modern web standards, HTML5 semantic elements, CSS box sizing, and advanced JavaScript ES6+ features (arrow functions, destructuring, Promises, async/await). We configured professional development environments in Visual Studio Code and mastered Git version control workflows (branching, merging, commit hygiene).

Week 2: React 18 Component Architecture & Vite Tooling

Week two focused on building dynamic Single Page Applications (SPAs) with React 18 and Vite. We mastered component hierarchy, state management using `useState` and `useEffect`, custom React hooks, and responsive utility styling using Tailwind CSS v3.

Week 3: Backend Architecture with Node.js & Express REST APIs

In week three, we engineered backend services using Node.js and Express. Key topics included request-response lifecycles, middleware pipelines, CORS configuration, JSON body parsing, and RESTful routing conventions.

Week 4: Cloud Database Setup with Supabase & OTP Authentication

Week four covered cloud database modeling with Supabase PostgreSQL. We designed JSONB schema structures for storing candidate profile data and implemented passwordless email authentication using Zoho SMTP 6-digit OTP verification.

CHAPTER 8 (CONTINUED)

12-WEEK TASK BREAKDOWN — WEEKS 5 TO 8: REMO AI & FOLIO AI

Weeks 5–6: Remo AI Resume Studio & PDFKit Vector Engine

Weeks five and six marked the development of Remo AI. We engineered the interactive resume editor and connected it to Groq SDK (Qwen 2.5 & Llama 3 models) for real-time bullet point refinement. On the backend, we built a coordinate-based rendering engine in PDFKit that maps content onto strict A4 page boundaries with dynamic height calculation.

Week 7: Folio AI Portfolio Generator & JSZip Packaging

Week seven focused on developing Folio AI. We designed four customizable portfolio themes (Bento Grid, Cyber Terminal, Modern Executive, Clean Glassmorphism) and integrated JSZip for zero-dependency client ZIP downloads containing standalone HTML, CSS, and JS.

Week 8: Talo AI ATS Alignment Engine & Keyword Auditing

In week eight, we built Talo AI, an ATS comparison engine that evaluates candidate resumes against target job descriptions to compute percentage match scores and highlight missing technical keywords.

CHAPTER 8 (CONTINUED)

12-WEEK TASK BREAKDOWN — WEEKS 9 TO 11: COVO, LIKO & MALI AI

Week 9: Covo AI Outreach Studio & PDF Cover Letter Generator

During week nine, we developed Covo AI, creating personalized recruiter cold emails, LinkedIn connection messages, and downloadable PDF cover letters formatted with professional headers and sign-offs.

Week 10: Liko AI LinkedIn Personal Branding Architect

Week ten focused on Liko AI, creating a personal branding tool that transforms career achievements into engaging LinkedIn posts with customizable hooks, hashtags, and optimized profile bios.

Week 11: Mali AI Campaign Studio & Background Queue Scheduler

In week eleven, we developed Mali AI, building a visual HTML email composer with 12 Google fonts, 7 theme palettes, dual time pickers, and an automated background queue worker (emailScheduler.js).

CHAPTER 8 (CONTINUED)

12-WEEK TASK BREAKDOWN — WEEK 12: SECURITY & FINAL DEMO

Week 12: Cybersecurity Hardening, Multi-Theme System & Final Evaluation

The final week focused on cybersecurity auditing, multi-theme visual polish, and technical project defense. We integrated an active security monitoring system (loginHistory.js) logging IP addresses and User-Agent signatures to issue multi-device alerts.

We also finalized the 10-theme visual design system with smooth cubic-bezier transitions, performed end-to-end regression testing, and successfully defended the ProForge AI platform during the final evaluation at Elite Forums.

Summary of Core Technical Deliverables Built During Training

- Remo AI: Resume Studio with 105+ layout options and strict A4 PDF compilation.
- Folio AI: 4 responsive portfolio templates with zero-dependency ZIP export.
- Talo AI: ATS alignment engine with keyword gap analysis.
- Covo AI: Cold outreach studio & dynamic cover letter generator.
- Liko AI: LinkedIn post generator & bio optimizer.
- Mali AI: Email campaign composer with background scheduling queue.

CHAPTER 9

TECHNICAL CHALLENGES ENCOUNTERED & ENGINEERING SOLUTIONS

1. Dynamic Coordinate Math & A4 Pagination in PDFKit

Challenge Encountered: Unlike web browsers where CSS reflows content automatically, PDFKit operates on strict (X, Y) pixel coordinates on a fixed A4 canvas. When users entered lengthy experience descriptions, text initially spilled over the bottom page boundary or broke awkwardly across pages.

Engineering Solution: I built a pre-render height calculation utility using `doc.heightOfString()` to measure every block of text before rendering. If an entry would push past the safe boundary (780 pt), the engine triggers `doc.addPage()` and recalculates vertical offsets cleanly.

2. Schema Enforcement from Non-Deterministic LLM Outputs

Challenge Encountered: During early Groq SDK testing, AI models occasionally returned conversational explanations or markdown code blocks instead of clean JSON, causing backend JSON parsing errors.

Engineering Solution: I enforced `response_format: { type: 'json_object' }` in Groq API calls and added a backend sanitization utility that strips markdown wrappers, guaranteeing 100% valid JSON objects.

CHAPTER 9 (CONTINUED)

BACKGROUND QUEUEING, SPRINT REFLECTIONS & STUDENT LEARNINGS

3. Asynchronous Background Scheduling for Email Campaigns

Challenge Encountered: Building Mali AI's campaign scheduler required running automated background dispatches without blocking the Node.js event loop or requiring heavy third-party Redis queue servers.

Engineering Solution: I created a lightweight polling queue worker inside `backend/services/emailScheduler.js` that runs on periodic intervals, checking for pending campaigns and dispatching them via Zoho SMTP safely.

Key Student Learnings & Professional Reflections

As a diploma student completing this training under the MSBTE curriculum, this internship provided immense technical and personal growth:

- **Full-Stack Mastery:** Transitioned from writing basic academic code to architecting production-grade React, Node.js, and PostgreSQL applications.
- **Debugging & Analytical Thinking:** Developed structured debugging skills using browser developer tools, Postman, and server logs.
- **Time Management:** Balanced daily on-site training sessions with independent capstone development across 12 intensive weeks.

CHAPTER 10

CONCLUSION, INDUSTRIAL EXPERIENCE & FUTURE SCOPE

My 12-week industrial training at Elite Forums, Vasai (East), has been an invaluable learning experience that successfully fulfilled all MSBTE Diploma curriculum objectives for Computer Engineering. The program provided a perfect bridge between theoretical academic concepts and live software industry practices.

Developing the ProForge AI platform enabled me to gain deep, hands-on expertise in React 18, Node.js, Express, Supabase PostgreSQL, Groq SDK LPU inference, and server-side PDFKit vector compilation. Overcoming complex engineering challenges—such as multi-model AI fallbacks and strict A4 coordinate math—significantly enhanced my problem-solving abilities and confidence.

Future Enhancements for ProForge AI

- Multi-Language Translation: Supporting automated resume translation into major Indian and international languages.
- AI Voice Mock Interviews: Building interactive voice-based mock interview simulations tailored to specific job descriptions.
- Placement Cell Portals: Developing multi-tenant institutional dashboards for polytechnic and engineering colleges.

In conclusion, this industrial training has equipped me with practical software engineering skills that will serve as a strong foundation for my future career in computer engineering.
